PANJWANI SOFTWA

1. What is the correct way to declare a variable in Python?

A) variable x

B) x = variable

C) x variable

D) x = 5

Answer: D) x = 5

Explanation: In Python, variables are declared using the format "variable_name = value". Option D is the correct way to declare and assign the value 5 to the variable x.

2. Which of the following is an invalid variable name in Python?

A) myVar

B) 2var

C) _var

D) Var2

Answer: B) 2var

Explanation: Variable names in Python cannot start with a number. Therefore, option B is an invalid variable name.

3. What is the output of the following code snippet?

```python
print(2 ** 3 ** 2)
```

A) 64

B) 512

C) 64.0

D) 576

Answer: A) 512

PANJWANI SOFTWARES

Explanation: The rightmost exponent, 3 ** 2, is calculated first, resulting in 9. Then, 2 ** 9 is evaluated, giving the final result of 512.

4. What is the output of the following code snippet?

```python
print(10 / 2)
```

A) 5.0

B) 5

C) 2.0

D) 2

Answer: A) 5.0

Explanation: In Python 3, the division operator (/) always returns a float result. Therefore, the result of 10 / 2 is 5.0.

5. What is the correct way to comment a single line in Python?

A) /* This is a comment */

B) # This is a comment

C) <!-- This is a comment -->

D) // This is a comment

Answer: B) # This is a comment

Explanation: In Python, the hash symbol (#) is used to indicate a single-line comment.

PANJWANI SOFTWARES

6. What is the output of the following code snippet?

```python
print("Hello" + " World!")
```

A) Hello World!

B) Hello + World!

C) HelloWorld!

D) Error

Answer: A) Hello World!

Explanation: The plus symbol (+) concatenates two strings together. Therefore, the output is "Hello World!".

7. What does the len() function do in Python?

A) Returns the length of a string

B) Returns the sum of two numbers

C) Returns the maximum value in a list

D) Returns the square root of a number

Answer: A) Returns the length of a string

Explanation: The len() function in Python returns the number of characters in a string.

PANJWANI SOFTWARES

8. What is the correct way to check if a key exists in a dictionary?

A) key in dict

B) dict.key()

C) dict.exists(key)

D) key.exists(dict)

Answer: A) key in dict

Explanation: The "in" operator is used to check if a key exists in a dictionary.

9. What is the output of the following code snippet?

```python
my_list = [1, 2, 3, 4, 5]
print(my_list[1:3])
```

A) [2, 3]

B) [1, 2]

C) [3, 4]

D) [1, 2, 3]

Answer: A) [2, 3]

Explanation: Slicing is used to extract a sublist from a list. In this case, the slice [1:3] includes elements

PANJWANI SOFTWARES

10. What is the output of the following code snippet?

```python
my_tuple = (1, 2, 3, 4, 5)
print(my_tuple[3])
```

A) 4

B) 5

C) (4, 5)

D) Error

Answer: A) 4

Explanation: Tuples are ordered collections of items, and indexing starts from 0. Therefore, my_tuple[3] accesses the fourth element of the tuple, which is 4.

11. Which of the following data types in Python is mutable?

A) String

B) Integer

C) Tuple

D) List

Answer: D) List

Explanation: Lists are mutable in Python, meaning their elements can be modified after they are created.

PANJWANI SOFTWARES

12. What is the correct way to open a file named "data.txt" in read mode in Python?

A) file = open("data.txt", "r")

B) file = open("data.txt", "w")

C) file = open("data.txt", "read")

D) file = open("data.txt")

Answer: A) file = open("data.txt", "r")

Explanation: To open a file in read mode, the second parameter in the open() function should be "r".

13. What is the purpose of the break statement in Python?

A) To terminate a loop and resume with the next iteration

B) To skip the current iteration and continue with the next iteration

C) To exit the entire program

D) To raise an exception

Answer: A) To terminate a loop and resume with the next iteration

Explanation: The break statement is used to prematurely exit a loop and resume execution from the next statement after the loop.

PANJWANI SOFTWARES

14. What is the output of the following code snippet?

```python
my_string = "Hello, World!"
print(my_string[7:12])
```

A) World!

B) World

C) o, Wor

D) o, Worl

Answer: B) World

Explanation: Slicing is used to extract a substring from a string. In this case, the slice [7:12] includes the characters from index 7 up to index 11, but not inclusive of index 12.

15. Which of the following is not a valid method for removing an element from a list in Python?

A) list.remove(element)

B) del list[index]

C) list.pop(index)

D) list.delete(element)

Answer: D) list.delete(element)

Explanation: The correct method to remove an element from a list in Python is list.remove(element), list.pop(index), or del list[index]. The method list.delete(element) does not exist.

PANJWANI SOFTWARES

16. What is the output of the following code snippet?

```python
my_dict = {"apple": 1, "banana": 2, "cherry": 3}
print(len(my_dict))
```

A) 1

B) 2

C) 3

D) 4

Answer: C) 3

Explanation: The len() function returns the number of key-value pairs in a dictionary. In this case, the dictionary contains three key-value pairs.

17. What is the correct way to import the math module in Python?

A) import math

B) import Math

C) from Math import math

D) from math import *

Answer: A) import math

Explanation: The correct syntax to import the math module in Python is import math. Option B is incorrect because Python is case-sensitive, and option C imports a specific item from the module, not the module itself. Option D imports all items from the math module,

PANJWANI SOFTWARES

18. Which of the following is not a valid Python data type?

A) String

B) Integer

C) Float

D) Character

Answer: D) Character

Explanation: In Python, there is no separate data type called "Character." Characters are represented as strings with a length of 1.

19. Which of the following statements is true about Python lists?

A) Lists can contain elements of different data types.

B) Lists can only store integers.

C) Lists are fixed in size and cannot be modified.

D) Lists can only store a maximum of 10 elements.

Answer: A) Lists can contain elements of different data types.

Explanation: Python lists are versatile and can contain elements of any data type, including integers, strings, floats, and even other lists.

PANJWANI SOFTWARES

20. What is the purpose of the "if" statement Error! Bookmark not defined.**in Python?**

A) To define a loop

B) To define a function

C) To perform a conditional check

D) To handle exceptions

Answer: C) To perform a conditional check

Explanation: The "if" statement in Python is used for conditional execution. It allows the program to make decisions based on certain conditions.
